SYSTEMS.NET

What do you need?

If you have or plan to install OPC Servers at your facility, then you are on your way to making your data available in the WatchIT OPC Cloud.

What can you do with the data?

- Setup and distribute information to users of the portal – assign tags and tag groups to select users or departments
- Turn on critical and informational alarms for users assigned to a particular group (i.e. HVAC, Facilities, and Operations).
- Create your own "personal portal" to display your favorite tags
- Set-up "personal alerts" to be notified when information changes
- Email Alerts
- MMS Text Alerts
- Web Based Trends and Excel Downloads of data

Why do I need WatchIT OPC?

Licensing cost of SCADA and HMI software is prohibitive for getting users other than production personnel data access. WatchIT OPC solves that problem by making process, environmental and utilities data available to users within your facility – you assign them only the data you want them to see. The security features allow you to expose tags and groups of tags only to the users that the system administrators decide.

Coming soon, we will be adding industry standard devices for electrical, gas, temperature, and Humidity that you can simply plug into your automation network and then the devices will instantly become available on your WatchIT Portal.

Need to track your Carbon Emissions or watch your manufacturing facility on the other side of the world? No problem, WatchIT OPC is for you.

WatchIT OPC allows your staff to be pro-active with alarm and event information and how it is handled. Unlike a typical alarm and email delivery service, WatchIT OPC allows you to direct the notifications to the correct users and groups.

From one convenient web-portal site, your users can access data from all process, environmental, and building management systems with absolutely no programming. If you can "drag and drop" then you can use WatchIT OPC.

Come on over to www.WatchITOPC.com and try it out. Remember – Absolutely no programming required!
